

DIRECT DEMOCRACY & SORTITION ASSEMBLIES

A Civic Architecture for the British Isles

DDSA-ARCH-IACF-001 | Edition 1.0

Inter-Assembly Co-ordination Framework

*A civic architecture for how Sortition Assemblies coordinate across the British Isles —
polycentric, networked, non-hierarchical*

Preamble: Design Philosophy

This framework governs how Sortition Assemblies (SAs) within the DD&SA system of the Civic Commonwealth of the British Isles coordinate their work, resolve conflicts, jointly administer shared assets, and protect the integrity of the overall architecture against drift, capture, and informal centralisation.

The Inter-Assembly Coordination Framework (IACF) does not create a central authority. It creates protocols. The distinction is foundational. A central authority accumulates power. A protocol distributes procedure. Every mechanism in this document is designed to facilitate the work of legitimately constituted SAs without creating any one body or role that might, over time, acquire the structural characteristics of executive government.

The design approach is polycentric and network-based. SAs are nodes, not subordinates. Coordination is lateral, not vertical. Where a single SA cannot act alone — because a matter crosses domain boundaries, territorial jurisdictions, or involves a conflict of mandate — this framework provides the tools for collective deliberation without hierarchy.

Five principles underpin every mechanism in this document:

- **Non-hierarchy:** No SA, panel, or coordination body stands above another in permanent authority.
- **Transparency:** All coordination processes, deliberations, evidence reviews, and resolutions are publicly recorded and resident-accessible.
- **Sortition integrity:** Where additional deliberative bodies are required, they are constituted by the same sortition principles as the parent assemblies — random selection from eligible resident pools, with appropriate diversity safeguards.
- **Resident sovereignty:** Residents retain the right to observe, access information about, and formally challenge any coordination decision.
- **Drift resistance:** The framework is designed to be self-auditing. Mechanisms exist to detect and correct any tendency toward informal hierarchy, domain dominance, or procedural capture.

PART I — PRINCIPLES AND ARCHITECTURE

1. Foundational Architecture of Inter-Assembly Coordination

1.1 The Polycentric Network Model

DD&SA operates a polycentric network model of governance. This means:

- There are multiple centres of decision-making authority, each constituted by sortition and limited to its defined domain or territory.
- No centre is permanently superior to another.
- Coordination between centres is achieved through defined protocols, not through the inherent authority of any one body.
- The network as a whole is self-regulating through systemic health review mechanisms described in Part V.

The model draws on the structural logic of polycentric governance theory — the insight that complex, multi-domain systems are more robust when decision authority is distributed — but adapts it fully to DD&SA's constraints of no parties, no executives, and universal transparency.

1.2 Categories of Sortition Assembly

The framework recognises two primary categories of SA, and their interaction is the basis of all coordination:

Category	Mandate Basis	Scope of Authority
Domain Assembly (DA)	Subject matter — a defined framework domain (health, transport, energy, education, digital, environment, and so on).	Sovereign within its domain across the whole territory; must assess territorial impact before implementation.
Territorial Assembly (TA)	Place — a defined geographic jurisdiction (Local, County, Regional, and National scale).	Sovereign over the full range of civic matters within its territory; implements domain decisions locally.

1.3 The Relationship Between Domain and Territorial Assemblies

Domain Assemblies hold mandate over subject matter. Territorial Assemblies hold mandate over place. Both are sovereign within their defined scope. Where subject matter and place intersect — as they almost always do — the following principles apply:

- Local implementation of domain decisions is the responsibility of the relevant Territorial Assembly, except where a Domain Assembly has been constituted with explicit local implementation powers under its founding charter.
- Domain Assemblies must conduct a Territorial Impact Assessment (TIA) before issuing any decision whose implementation will fall materially on a specific territory or set of territories.
- Territorial Assemblies may request a Joint Coordination Panel where a Domain Assembly decision requires local adaptation or creates an unacceptable burden on a particular territory.
- Neither category of assembly may unilaterally override the other. Disputes between them are resolved through the Conflict Resolution Architecture defined in Part III.

1.4 The Shared Civic Information Platform

The Shared Civic Information Platform (SCIP) is the technical and institutional infrastructure through which all SAs share evidence, decisions, deliberation records, and coordination data. SCIP is not a governance body. It has no decision-making authority. It is a civic utility.

SCIP functions include:

- **Public Evidence Repository:** All evidence submitted to any SA in any deliberative process is published in full on SCIP, accessible to residents and to any other SA.
- **Decision Register:** All SA decisions, including the reasoning, dissenting positions, and voting records where applicable, are published on SCIP within five working days of adoption.
- **Coordination Log:** All inter-assembly coordination activities — joint sessions, JCP proceedings, CRP adjudications — are logged, indexed, and searchable.
- **Precedent Archive:** Non-binding records of how previous coordination conflicts were resolved, maintained to support future deliberation without creating rigid legal precedent.
- **Territorial Impact Register:** A live map-based tool showing which SA decisions are currently affecting or pending for each territory, enabling residents to identify relevant decision-making processes.

SCIP is administered by a Civic Data Stewardship Assembly (CDSA) — a standing sortition-constituted body with a single mandate: to maintain the platform's technical integrity, accessibility, and neutrality.

The CDSA has no power to modify, suppress, or selectively publish any content. It may only maintain and improve access.

1.5 Assembly Liaison Registers

Each Domain Assembly and each Territorial Assembly at regional and national scale maintains an Assembly Liaison Register — a publicly visible record of which other assemblies it is currently engaged with on coordination matters, what the subject of each engagement is, and what stage the coordination process has reached. This register is updated weekly and is published on SCIP.

The Liaison Register does not create obligations. It creates transparency. Residents can see, at any time, whether any two assemblies are in coordination, dispute, or joint deliberation. This prevents back-channel arrangements and makes informal influence visible.

1.6 Coordination Triggers: When Coordination is Required

Inter-assembly coordination is required whenever any of the following conditions applies:

- **Cross-domain impact.** A Domain Assembly decision will materially affect the mandate, operations, or service delivery of one or more other Domain Assemblies.
- **Cross-territory impact.** A decision by any assembly will materially affect a territory other than the one in which it is taken, or a shared asset spanning multiple territories.
- **Shared-asset governance.** A matter concerns an asset listed on the Shared Territorial Asset Register, requiring joint stewardship by two or more Territorial Assemblies.
- **Mandate intersection or overlap.** Two or more assemblies assert, or appear to hold, mandate over the same matter, creating a risk of duplication, gap, or conflict.
- **Sequencing dependency.** Two or more assemblies hold inter-dependent decisions whose order materially affects their mutual viability.
- **Declared conflict.** Any SA has formally declared a conflict with another under the Conflict Resolution Architecture of Part III.

PART II — CROSS-DOMAIN COORDINATION

2. Principles of Cross-Domain Coordination

2.1 Why Cross-Domain Coordination is Structurally Necessary

No civic domain exists in isolation. Health outcomes depend on housing quality, transport access, environmental conditions, and educational attainment. Transport infrastructure shapes economic activity, affects air quality, and determines the viability of communities. Digital infrastructure is increasingly the substrate on which all other domains depend. These interdependencies are not administrative inconveniences; they are the structural reality of civic life.

The DD&SA system does not attempt to collapse all domains into a single assembly. Domain specialism produces better deliberation, deeper expertise among sortition members, and clearer accountability. But domain specialism without coordination produces incoherence, duplication, and unintended harm. The purpose of cross-domain coordination is to preserve the integrity of domain deliberation while ensuring that no domain acts as an island.

2.2 The Cross-Domain Impact Assessment

Before any Domain Assembly issues a decision with material cross-domain implications, it must complete a Cross-Domain Impact Assessment (CDIA). The CDIA is a structured, published document that answers the following questions:

- **Primary domain mandate:** What is the decision, and how does it fall within this assembly's defined mandate?
- **Affected domains:** Which other Domain Assemblies have a mandate that intersects with this decision? List all affected domains and describe the nature of the intersection.
- **Impact characterisation:** For each affected domain, describe the anticipated impact — operational, financial, or in terms of service delivery — in plain language accessible to residents.
- **Mitigation options:** What decisions or adjustments could be made to reduce negative cross-domain impacts? Have these been considered?
- **Notification and coordination:** Has each affected Domain Assembly been formally notified? Have they responded? If a Joint Coordination Panel has been requested, what is its status?

The CDIA is published on SCIP before the decision is adopted. Affected Domain Assemblies have a minimum of twenty working days to review the CDIA and register a formal response. If a formal response objects to the proposed decision on cross-domain grounds, the proposing assembly must either convene a joint session with the objecting assembly or refer the matter to a Joint Coordination Panel before proceeding.

2.3 Joint Sessions

A joint session is a formal deliberative meeting attended by representatives of two or more SAs. Joint sessions are:

- Convened by formal agreement of the assemblies concerned, or by a mandatory referral under Section 2.2 above.
- Chaired by a sortition-selected Civic Facilitator — an individual drawn from outside the assemblies involved, selected randomly from the Civic Facilitator Register maintained on SCIP.
- Fully open to resident observation, with live-stream and published transcript as standard.
- Governed by a published agenda, agreed between the assemblies at least ten working days in advance.
- Required to produce a Joint Session Record, published on SCIP within five working days, setting out what was discussed, what was agreed, and what remains unresolved.

A joint session may result in:

- A **Joint Coordination Decision** — a formally adopted position agreed by all participating assemblies, binding on all parties within their respective domains.
- A referral to a **Joint Coordination Panel**, where the joint session has been unable to reach agreement.
- A **Decision to Proceed** — where the proposing assembly's CDIA has been reviewed by affected assemblies and no material objection has been registered.

2.4 Joint Coordination Panels

A Joint Coordination Panel (JCP) is a temporary, sortition-constituted body formed to deliberate on a specific cross-domain matter that cannot be resolved through joint session alone. Its key characteristics are:

- Constituted by sortition from a combined eligible pool drawn from the resident populations of all territories affected by the matter in question.
- **Panel size:** between twelve and thirty members, scaled to the complexity and territorial scope of the matter.
- **Diversity requirements:** the same demographic diversity protocols as parent assemblies apply.
- **Time-limited:** the JCP mandate defines a specific decision or set of decisions. Once those decisions are issued, the JCP is dissolved.
- **No standing authority:** the JCP holds no ongoing power and cannot issue decisions beyond its defined mandate.
- **Evidence-based:** the JCP receives full SCIP access, independent expert evidence, and positions from all relevant assemblies.

2.5 JCP Formation Protocol

The following steps govern JCP formation:

- **Referral:** A JCP is referred by a joint session, by a Conflict Resolution Panel, or by two or more assemblies jointly submitting a JCP Request Form to SCIP.
- **Mandate Definition:** The assemblies making the referral jointly draft a Mandate Document specifying the decision or decisions the JCP must address, the evidence base it will work from, the timeline, and the criteria by which its output will be evaluated.
- **Sortition Draw:** The CDSA administers a verified sortition draw from the eligible resident pool. The draw is public and witnessed.
- **Induction:** JCP members receive a structured induction covering the mandate, relevant SCIP evidence, positions of all affected assemblies, and the DD&SA coordination protocols.
- **Deliberation:** The JCP deliberates over a defined period (minimum ten working days, maximum forty-five working days unless a time extension is agreed by all referring assemblies).
- **Output:** The JCP issues a Coordination Directive, which is binding on all assemblies within the scope of the mandate.
- **Dissolution:** The JCP is formally dissolved. Its full record is archived on SCIP.

2.6 Concrete Examples of Cross-Domain Coordination

Example A: New Civic Hospital Requiring Transport Infrastructure Changes

Scenario: The Civic Health Assembly for a Regional Civic Assembly area decides to site a new District Civic Hospital. The siting decision will require new bus corridors, road capacity upgrades, and a potential rail halt. It also requires planning decisions within the jurisdiction of the Local Civic Assembly and significant digital infrastructure investment for connected care systems.

Coordination pathway:

- The Civic Health Assembly completes a CDIA identifying the Civic Transport Assembly, the Civic Digital Infrastructure Assembly, and two Local Civic Assemblies as affected parties.

- Formal notifications are issued. All four affected assemblies have twenty working days to respond.
- The Civic Transport Assembly responds with a formal objection, noting that the proposed access corridors conflict with a pre-existing Cycling Infrastructure Plan under deliberation.
- A joint session is convened between the Civic Health Assembly and Civic Transport Assembly, facilitated by a sortition-selected Civic Facilitator.
- The joint session cannot reach agreement on corridor sequencing and refers the matter to a Joint Coordination Panel.
- The JCP is constituted from the combined resident pool of the affected regional area.
- The JCP hears evidence from both assemblies, from the two Local Civic Assemblies, from the Civic Digital Infrastructure Assembly, and from independent transport and health planning experts.
- The JCP issues a Coordination Directive specifying: the hospital siting decision proceeds; transport corridor design must incorporate the cycling infrastructure plan; a phased timeline is mandated; and digital infrastructure requirements are referred to a separate, parallel CDIA process.
- All assemblies are bound by the Directive within their respective mandates. The Directive is published on SCIP.

Example B: Education Reform Requiring Digital Infrastructure Upgrades

Scenario: The Civic Education Assembly adopts a national curriculum reform requiring high-bandwidth connected learning in all Civic Schools. Many schools in rural Local Civic Assembly areas lack the necessary connectivity. The reform cannot be implemented without prior digital infrastructure investment.

Coordination pathway:

- The Civic Education Assembly's CDIA identifies the Civic Digital Infrastructure Assembly and seventeen rural Local Civic Assemblies as materially affected.
- The Civic Digital Infrastructure Assembly's response confirms that the required infrastructure is technically feasible but requires budget allocation from the Civic Resource Allocation Assembly and a three-year delivery timeline.
- A joint session between the Civic Education Assembly, the Civic Digital Infrastructure Assembly, and the Civic Resource Allocation Assembly reaches a joint position: the reform is adopted in principle; implementation is phased, with high-connectivity areas proceeding immediately and rural areas following a defined infrastructure-first pathway.
- The Joint Session Record is published. The phasing plan constitutes a Joint Coordination Decision binding on all three assemblies.
- Local Civic Assemblies in rural areas are notified of the phasing timeline and may register concerns through their Regional Civic Assembly if the timeline is unacceptable.

2.7 Sequencing Decisions: The Priority Queue Protocol

Where two or more assemblies have inter-dependent decisions in progress simultaneously, and where the order of decisions matters to their mutual viability, the assemblies must agree a Decision Sequence Order (DSO). The DSO specifies:

- Which decision must be made first (the antecedent decision).
- What the downstream decision-makers need to know from the antecedent decision before they can proceed.

- A maximum waiting period, after which the downstream assembly may proceed on its best-available evidence with a formal note that the DSO sequence was not completed.

DSO agreements are logged on SCIP and form part of the Coordination Log. Where assemblies cannot agree a DSO, they may refer to a JCP for arbitration on sequencing alone.

2.8 No Unilateral Cost Imposition

No Domain Assembly may issue a decision that imposes a material financial cost, operational burden, or service delivery obligation on another Domain Assembly or Territorial Assembly without first completing a CDIA and either: (a) receiving no formal objection; (b) reaching a Joint Coordination Decision through joint session; or (c) receiving a Coordination Directive from a JCP.

Any decision issued in breach of this rule is subject to suspension pending CDIA completion, on petition from any affected assembly. The suspension petition is lodged with SCIP, is publicly visible, and triggers an automatic twenty-day consultation period before any suspension order is issued by a Conflict Resolution Panel.

PART III — CONFLICT RESOLUTION BETWEEN ASSEMBLIES

3. The Conflict Resolution Architecture

3.1 Definition of a Conflict

A conflict between SAs exists when any of the following conditions is formally declared by one or more assemblies. This taxonomy of conflict types is referenced throughout this Part:

Type	Conflict	Description
Type 1	Mandate conflict	Two or more assemblies assert authority over the same matter, or one acts in a way another contends exceeds its mandate.
Type 2	Cross-domain impact conflict	A decision materially harms another domain's operations or service delivery without an agreed CDIA resolution.
Type 3	Cross-territory impact conflict	A decision imposes unacceptable burden, cost, or harm on another territory or a shared asset.
Type 4	Resource or cost conflict	Disagreement over the allocation of cost or responsibility for a shared asset or joint programme.
Type 5	Procedural conflict	An assembly is alleged to have breached the coordination procedures of this framework (e.g., omitting a required CDIA or CTIA).

3.2 Conflict Declaration

A conflict is formally declared when any SA submits a Conflict Declaration Form (CDF) to SCIP. The CDF must include:

- The type of conflict (from the taxonomy above).
- The identity of the other SA(s) involved.
- A factual statement of the matter in dispute, with supporting evidence published on SCIP.
- What resolution the declaring assembly seeks.
- A statement of what informal resolution has already been attempted and why it was unsuccessful.

A CDF is published on SCIP immediately on submission. Residents can see all active conflict declarations. The SA(s) named in the CDF have ten working days to submit a formal Response

Statement, which is also published on SCIP.

3.3 Pre-Panel Mediation

On receipt of a CDF, SCIP automatically triggers a Pre-Panel Mediation period of fifteen working days. During this period:

- A Civic Mediator, sortition-selected from the Civic Facilitator Register, contacts all parties and attempts to facilitate a negotiated resolution.
- The Civic Mediator has no authority to impose a resolution. Their role is facilitative only.
- All mediation sessions are conducted openly and their records published on SCIP.
- If a negotiated resolution is reached, it is published as a Mediated Coordination Agreement on SCIP and becomes binding on all parties.
- If no resolution is reached within fifteen working days, the matter proceeds automatically to Conflict Resolution Panel formation.

3.4 Conflict Resolution Panel Formation

A Conflict Resolution Panel (CRP) is a temporary sortition-constituted body formed to adjudicate a specific inter-assembly conflict. Formation proceeds as follows:

- **Eligibility Pool:** The CRP is drawn from resident populations of all territories affected by the conflict, excluding current members of any assembly party to the conflict.
- **Panel Size:** Between fifteen and twenty-five members, scaled to the complexity of the conflict. The CDSA determines size based on a standard assessment rubric.
- **Diversity Requirements:** Standard DD&SA sortition diversity protocols apply.
- **Independence Declaration:** All CRP members must declare any connection to the matter in dispute. The sortition draw process allows for proportionate challenges by the parties.
- **Panel Chair:** A Civic Facilitator is sortition-selected to chair the CRP. The Chair has procedural authority only — they manage process, not substance.
- **Timeline:** The CRP must issue its resolution within thirty working days of formation. A single extension of up to fifteen working days may be granted by consensus of all parties.

3.5 Conflict Resolution Panel Procedures

3.5.1 Evidence Gathering

On formation, the CRP issues an Evidence Request to all parties and to SCIP. All assemblies party to the conflict must submit:

- A Position Statement setting out their account of the conflict, the basis of their mandate claim, and the resolution they seek.
- All relevant SCIP-published decisions, CDIAs, joint session records, and Assembly Liaison Register entries pertaining to the conflict.
- Any independent expert evidence they consider relevant.

The CRP may commission independent expert evidence at its own discretion, funded through the Civic Coordination Resource Fund (CCRF), described in Section 3.9 below. All evidence gathered by the CRP is published on SCIP in full.

3.5.2 Assembly Hearings

Each assembly party to the conflict is given equal time to present its position to the CRP in a formal open hearing. All hearings are live-streamed and fully transcribed. Resident observers may submit written questions to the CRP Chair for consideration, subject to the Chair's discretion on relevance and time.

3.5.3 Deliberation

Following the hearings, the CRP deliberates in open session. Deliberation is not a debate between parties; it is an internal process of the CRP. Parties are not present during CRP deliberation, though the deliberation is publicly observable. The CRP's deliberation process follows the standard DD&SA structured dialogue protocol:

- **Open round:** Each member shares their initial assessment without interruption.
- **Evidence review:** The panel collectively reviews the evidence base, noting areas of factual agreement and dispute.
- **Key questions round:** Members identify the two or three questions whose answers would most inform the resolution.
- **Expert response:** Where expert evidence is relevant, the CRP may invite written clarification from experts.
- **Drafting round:** A subgroup of four members drafts a proposed resolution for consideration by the full panel.
- **Review and adoption:** The full panel reviews the draft, proposes amendments, and adopts a final resolution by simple majority. Dissenting positions are recorded.

3.5.4 The Resolution

A CRP resolution is a Coordination Directive. It is binding on all parties within their respective mandates. A Coordination Directive may:

- Assign primary mandate authority to one of the competing assemblies for a defined matter.
- Define shared mandate arrangements, specifying each assembly's role and limits.
- Require one or more assemblies to modify, delay, or withdraw a decision.
- Establish a permanent Joint Coordination Panel for an ongoing shared governance matter.
- Require a CDIA to be completed before a decision may proceed.
- Specify a remedial process for any procedural violation found under Type 5 conflicts.

A Coordination Directive is published on SCIP in full, with the full evidence record, hearing transcripts, and deliberation record, within five working days of adoption.

3.6 Handling Deadlocks

If a CRP cannot reach a majority resolution within its allotted time — a genuine deadlock — the following sequential procedure applies:

- **Extended deliberation:** The CRP is granted a mandatory ten-working-day extension. No further extensions are available.
- **Resident Input Round:** During the extension, a structured resident input process is conducted. A representative sample of residents from the affected territories is convened by sortition for a single deliberative session, which produces a non-binding advisory position. This advisory position is

shared with the CRP.

- **Fallback to Interim Position:** If the CRP still cannot reach majority resolution, it issues an Interim Coordination Position — the least-restrictive option consistent with preventing active harm — which governs the matter on a temporary basis for a period not exceeding twelve months.
- **Reconstitution:** A new CRP is constituted by fresh sortition draw to re-examine the matter within the twelve-month period, with a mandate to produce a full Coordination Directive.

3.7 Resident Observation and Challenge Rights

All CRP processes are fully open to resident observation. Residents who believe a CRP has erred — whether procedurally or substantively — may submit a Resident Review Request (RRR) to SCIP within thirty working days of the Coordination Directive's publication. An RRR must be supported by a minimum of two hundred resident signatures from the affected territory.

An RRR triggers a Review by a newly constituted sortition panel of seven residents, drawn from outside the original CRP pool, who assess whether the CRP process was conducted in accordance with this framework and whether the resolution contains a material factual error. The Review Panel may:

- Confirm the resolution.
- Refer the resolution back to a newly constituted CRP with specific grounds for reconsideration.

The Review Panel cannot overturn a Coordination Directive on substantive grounds alone — only on procedural breach or factual error. Substantive disagreement with a Coordination Directive is addressed through the resident petition and assembly review processes of the relevant assemblies.

3.8 The Precedent Archive

DD&SA does not operate a court-based precedent system. No CRP resolution is automatically binding in future disputes. However, the Precedent Archive on SCIP maintains a searchable record of all Coordination Directives, cross-referenced by conflict type, domain, territory, and subject matter. Future CRPs are required to consult the Precedent Archive as part of their evidence gathering. They are encouraged — but not required — to give reasons if they depart from a previous resolution on materially similar facts.

The purpose of the Precedent Archive is consistency and institutional memory, not legal rigidity. DD&SA's deliberative model depends on context-sensitive reasoning by resident panels; the Precedent Archive supports rather than supplants that reasoning.

3.9 The Civic Coordination Resource Fund

The Civic Coordination Resource Fund (CCRF) is a ring-fenced allocation within the national Civic Budget administered by the Civic Resource Allocation Assembly. It funds:

- Sortition processes for JCPs and CRPs.
- Independent expert evidence commissioned by JCPs and CRPs.
- Civic Facilitator and Civic Mediator services.
- SCIP operational and development costs.
- Resident input processes triggered under deadlock procedures.

The CCRF is not available to fund individual assembly litigation-style advocacy. Each assembly funds its own representation from its operational budget.

PART IV — CROSS-TERRITORY GOVERNANCE

4. Cross-Territory Governance Architecture

4.1 The Challenge of Shared Territory

Many of the most consequential civic assets do not respect territorial boundaries. Rivers carry water — and pollution — across multiple jurisdictions. Transport corridors connect territories whose assemblies may have different visions of their use and development. Energy grids are physical networks whose integrity depends on decisions made by actors spread across dozens of territories. Shared ecosystems — upland watersheds, coastal zones, urban green networks — require stewardship decisions that affect downstream and adjacent communities.

The cross-territory governance architecture of DD&SA must address these realities without creating permanent supra-territorial authorities — which would be a form of executive government by another name — and without leaving shared assets ungoverned by default.

The solution is a framework of Shared Asset Charters, Joint Territorial Assemblies, and Territorial Impact Protocols that give every affected territory a defined voice in shared governance while ensuring that shared assets are actively and responsibly managed.

4.2 The Shared Territorial Asset Register

The Shared Territorial Asset Register (STAR) is maintained on SCIP and lists every identified asset that spans or materially affects more than one territorial jurisdiction. STAR entries include:

- Asset type and description.
- The territories whose assemblies hold a stake in its governance.
- The current governance arrangement (Shared Asset Charter, JTA, Standing JCP, or pending).
- The responsible assembly or panel for each governance function.

Any Territorial Assembly may nominate an asset for inclusion in STAR. Nominations are reviewed by the CDSA, which verifies territorial span and publishes all nominations and decisions.

4.3 Shared Asset Charters

A Shared Asset Charter (SAC) is a governance agreement between two or more Territorial Assemblies defining how they will jointly manage a shared asset. An SAC must specify:

- The asset covered and its boundaries or scope.
- Which Territorial Assemblies are parties.
- The governance structure: whether a Joint Territorial Assembly is required, or whether the matter can be managed through a Standing Joint Coordination Panel.
- Each party's rights and responsibilities — including maintenance obligations, cost-sharing formulae, and service delivery standards.
- Decision-making rules: what decisions can be made by a single assembly acting within its territory; what decisions require joint agreement.
- Dispute resolution pathway: how disagreements between parties are escalated.
- Review cycle: when the SAC is subject to full review (minimum every five years).

An SAC is drafted jointly by the parties, adopted by each party's assembly through its standard deliberative process, and published in full on SCIP. Amendments require the consent of all parties and must go through a joint deliberative process.

4.4 Joint Territorial Assemblies

A Joint Territorial Assembly (JTA) is a standing sortition-constituted body formed to govern a specific shared asset or cross-territory matter on an ongoing basis. JTAs are appropriate where:

- The asset requires frequent, complex governance decisions that exceed what occasional joint sessions can manage.
- The asset affects more than three Territorial Assemblies.
- The asset has direct, continuous impact on residents' daily lives — such as a major river system or a regional energy grid.

A JTA is not a supra-territorial government. Its mandate is strictly defined by its founding SAC and is limited to governance of the specified asset. It has no power to issue decisions on any matter beyond its mandate.

4.5 JTA Composition and Accountability

JTA members are selected by sortition from the combined resident populations of all territories party to the founding SAC. Representation is weighted to ensure each territory's residents have proportionate influence, using a formula agreed in the SAC. JTA members serve fixed terms, subject to the same term limits and rotation principles as domain assemblies.

Each JTA is accountable to:

- **Its founding SAC parties** — each party assembly retains the right to review JTA decisions and petition for review through the Conflict Resolution Architecture if a decision falls outside the JTA's mandate.
- **Residents of all territories** — JTA deliberations are fully open, published on SCIP, and subject to Resident Review Request procedures.
- **The System Health Review process** described in Part V.

4.6 Domain-Specific Cross-Territory Protocols

4.6.1 Rivers and Watersheds

Rivers and their watersheds are governed by the Civic Waterway Charter (CWC) model. Under a CWC:

- All Territorial Assemblies whose land drains into a defined watershed are parties.
- A Watershed JTA is constituted, with mandate over water quality standards, abstraction limits, flood risk management, and ecological restoration across the watershed.
- The upstream–downstream principle applies: no upstream territory may issue a decision that materially degrades water quality or increases flood risk for downstream territories without completing a Cross-Territory Impact Assessment (CTIA) and receiving JTA approval.
- The CTIA is the cross-territory equivalent of the CDIA (defined in Part II), requiring upstream assemblies to model downstream impacts and publish findings on SCIP.
- Downstream territories have standing to petition the CRP if an upstream decision proceeds without CTIA completion.

4.6.2 Transport Corridors

Transport corridors — major roads, rail lines, cycle networks, and waterways used for transit — require coordinated governance across territorial boundaries. The Corridor Governance Protocol (CGP) applies:

- The territories through which a corridor passes constitute a Corridor Assembly Group (CAG) for that corridor.
- The CAG governs decisions about corridor capacity, safety standards, maintenance obligations, and access arrangements through a Corridor SAC.
- Decisions about corridor extension or significant modification require agreement from all CAG members and completion of a CTIA covering all affected territories.
- Where a corridor is under domain jurisdiction (e.g., the Civic Transport Assembly holds national mandate for rail), the Domain Assembly must complete a CTIA and engage with all affected Territorial Assemblies before any significant modification.
- Cost-sharing for maintenance and investment follows a formula agreed in the Corridor SAC, typically based on use intensity and population served.

4.6.3 Energy Grids and Shared Infrastructure

Energy grids are physical networks requiring constant operational decisions alongside longer-term capacity and investment planning. The Grid Governance Protocol (GGP) provides:

- A Grid JTA is constituted for each major grid network (electricity transmission, gas distribution, and any future hydrogen or thermal networks).
- The Grid JTA holds mandate over network integrity, safety standards, grid expansion planning, and emergency response protocols.
- Investment and capacity decisions above a defined threshold require a Grid JTA Coordination Directive, preceded by a full CTIA published on SCIP.
- Local and regional energy generation decisions (community renewables, local grid connections) remain within the mandate of local Territorial Assemblies, subject to Grid JTA safety and integration standards.
- Grid JTA decisions are subject to review by the Civic Environment Assembly where they have material climate or environmental impacts.

4.6.4 Shared Ecosystems and Environmental Zones

Ecosystems that span territorial boundaries — upland moors, coastal zones, estuaries, urban green networks, ancient woodlands — require an ecological governance approach that is both place-based and long-term. The Ecological Zone Charter (EZC) model applies:

- An Ecological Zone is designated by petition from two or more Territorial Assemblies, confirmed by the Civic Environment Assembly following a published ecological assessment.
- All territories within or adjacent to the zone are parties to an EZC.
- An Ecological Zone JTA governs land use, development restrictions, restoration obligations, and ecological monitoring within the zone.
- The Civic Environment Assembly holds a standing right of review over Ecological Zone JTA decisions and may issue advisory positions, though it may not override JTA decisions unilaterally — only through the CRP process.

- Ecological Zones operate under the Generational Covenant Clause (DDSA-ARCH-001, Part X): decisions must consider impacts over a minimum fifty-year horizon and may not be reversed within a ten-year moratorium period without a supermajority JTA resolution and a CTIA.

4.6.5 Digital Networks and Data Infrastructure

Digital infrastructure — broadband networks, public data centres, sensor networks, and civic digital platforms — increasingly spans territorial boundaries and is foundational to all other domains. The Digital Infrastructure Governance Protocol (DIGP) provides:

- The Civic Digital Infrastructure Assembly holds national mandate for network architecture standards, interoperability requirements, and data sovereignty rules.
- Territorial Assemblies hold mandate for local infrastructure deployment, public access provision, and community digital services within national standards.
- Where a major digital infrastructure project spans multiple territories, the proposing assembly must complete a CTIA covering all affected territories.
- The Sovereign Digital Network (SDN) — DD&SA's constitutional digital infrastructure — is governed directly by the Civic Digital Infrastructure Assembly, with JTA governance for regional nodes where warranted by scale.

4.7 Cross-Territory Impact Assessment Protocol

The Cross-Territory Impact Assessment (CTIA) mirrors the CDIA in structure but is applied to territorial rather than domain impacts. A CTIA is required whenever a Territorial Assembly or Domain Assembly proposes a decision with material cross-territory consequences. The CTIA must answer:

- **Territorial scope:** Which territories are materially affected, and in what way?
- **Upstream–downstream analysis:** Where relevant, what are the upstream and downstream consequences of the decision? Who bears the costs and who receives the benefits?
- **Ecological and environmental analysis:** What are the long-term ecological consequences, including on shared ecosystems and waterways?
- **Infrastructure interdependency:** What infrastructure dependencies (transport, energy, digital) does the decision engage?
- **Consultation record:** Have all affected Territorial Assemblies been formally notified? Have they responded?
- **Proposed mitigation:** What measures have been proposed to mitigate harm to affected territories?

CTIAs are published on SCIP. Affected assemblies have twenty working days to respond. If a formal objection is lodged, the proposing assembly must convene a joint session or refer to a JCP before proceeding.

4.8 Cost and Responsibility Sharing

All Shared Asset Charters and JTA founding documents must include a Cost and Responsibility Sharing (CRS) Schedule that defines:

- How maintenance and operational costs are allocated between parties (e.g., per capita, by use, by geographic footprint, or by negotiated formula).
- How capital investment costs are allocated for new or enhanced infrastructure.

- How cost disputes are escalated and resolved (defaulting to the CRP process if bilateral negotiation fails).
- How cost formulae are reviewed and updated over time.

The default principle for cost sharing is equal service standard per resident: no territory's residents should receive a materially inferior service from a shared asset simply because their territory's assembly has less financial capacity. Where this principle requires cross-subsidy, the CRS Schedule must explicitly acknowledge this and provide a rationale consistent with the Civic Floor standard (DDSA-ARCH-001, Part I).

4.9 Initiating, Deliberating, and Approving Cross-Territory Projects

A cross-territory project is any planned development, infrastructure investment, or service change that requires decisions from more than one Territorial Assembly or from both a Domain Assembly and one or more Territorial Assemblies. The approval pathway is:

- **Project Proposal:** Any assembly may initiate a cross-territory project by submitting a Project Proposal to SCIP, identifying all potentially affected assemblies.
- **Scoping Assessment:** Within ten working days, the CDSA publishes a Scoping Assessment identifying all assemblies with a governance stake in the project.
- **CTIA Completion:** The proposing assembly completes a full CTIA, published on SCIP.
- **Consultation Period:** All affected assemblies have thirty working days to respond.
- **Joint Deliberation:** If the project requires decisions from multiple assemblies, a Joint Project Panel (a form of JCP with cross-territory composition) is convened to deliberate the project as a whole.
- **Approval:** The Joint Project Panel issues a Project Coordination Directive specifying each assembly's mandate for implementation, the timeline, the CRS Schedule, and the monitoring arrangements.
- **Implementation Monitoring:** A Monitoring Panel (smaller sortition draw) tracks implementation against the Directive and publishes quarterly progress reports on SCIP.
- **Completion Review:** On project completion, a full review is published on SCIP, available for inclusion in the Precedent Archive.

PART V — SAFEGUARDS, DRIFT PREVENTION, AND STRESS-TESTING

5. System Integrity and Drift Prevention

5.1 The Threat Model

Even a well-designed coordination framework can degrade over time. The most serious degradation risks for DD&SA's inter-assembly coordination system are the following six threat indicators, each monitored and scored under the Annual Coordination Health Review:

#	Threat	Description
1	Informal hierarchy	A coordination body or role begins to acquire de facto authority over assemblies, drifting toward executive government.
2	Domain dominance	A single Domain Assembly consistently shapes outcomes across multiple domains beyond its mandate scope.
3	Procedural capture	Coordination procedures are routinely bypassed, gamed, or used to entrench one assembly's advantage.
4	Transparency erosion	Coordination activity migrates to back-channels; SCIP records become incomplete, delayed, or opaque.
5	Sortition dilution	Panels are increasingly staffed by repeat participants or insiders, weakening fresh resident input.
6	Coordination paralysis	Excessive or deadlocked process prevents timely decisions, eroding confidence and inviting unilateral action.

5.2 The Annual Coordination Health Review

Each year, the CDSA commissions an Annual Coordination Health Review (ACHR). The ACHR is conducted by a sortition-constituted Review Assembly of thirty residents, drawn from across all territories, who are not currently serving on any other assembly or panel. The Review Assembly:

- Analyses the full SCIP Coordination Log for the preceding twelve months.
- Assesses each of the six threat indicators listed in Section 5.1 using a published scoring rubric.
- Reviews all Coordination Directives for evidence of pattern bias (i.e., whether any assembly's positions have been consistently upheld).
- Assesses CDIA and CTIA completion rates across all assemblies.
- Reviews panel member retention and deliberation quality indicators.
- Surveys a representative sample of sortition panel members about their experience.

The ACHR produces a published annual report, with specific recommendations for process improvements, issued to all assemblies and to the Civic Resource Allocation Assembly. Recommendations from the ACHR are not automatically binding, but any assembly that declines to implement an ACHR recommendation must publish a reasoned response within sixty working days.

5.3 Resident-Initiated Reviews

Residents may initiate a targeted review of any aspect of the inter-assembly coordination system by submitting a Resident Coordination Review Petition (RCRP) to SCIP. A petition requires:

- A minimum of one thousand resident signatures from the affected territory or territories.
- A specific concern or question about the coordination system — not a general dissatisfaction.

- A statement of what evidence or information the petitioners believe has not been adequately considered.

A valid RCRP triggers the formation of a Resident Review Panel of fifteen residents (sortition-selected, excluding current assembly members and the petitioners' immediate network). The Review Panel examines the specific concern, publishes its findings on SCIP, and makes recommendations to the relevant assemblies. The Review Panel does not have power to overturn decisions but may trigger a formal review by existing assemblies or, in cases of procedural breach, a CRP.

5.4 Drift Indicators and Automatic Response Triggers

The following quantitative indicators are monitored automatically by SCIP and published monthly. Where an indicator breaches a defined threshold, an automatic response is triggered:

Indicator	Threshold	Automatic Response
Assembly coordination concentration	One assembly party to more than 40% of active coordination processes	Flagged as a Coordination Log anomaly; dedicated ACHR section; PMR brought forward.
CDIA / CTIA completion rate	Below 90% for any assembly over a rolling quarter	Notice to the assembly; CCSO support engaged; reported in the ACHR.
Directive pattern bias	One assembly's position upheld in more than 75% of directives it is party to	Independent review of the affected directives for systemic bias.
Back-channel signal	Coordination outcomes not traceable to logged SCIP activity	Transparency audit by the CDSA; Liaison Registers re-examined.
Panel repeat-participation	Repeat panellists exceed the diversity-protocol ceiling	Sortition pool refreshed; draw parameters reviewed.
Process latency	Median coordination matter exceeds its protocol time limit by 50%	Paralysis review; bottleneck identified; CCSO process support.

5.5 Periodic Mandate Reviews

Every five years, each Domain Assembly and each Regional and National Territorial Assembly undergoes a Periodic Mandate Review (PMR). The PMR assesses:

- Whether the assembly's mandate definition remains fit for purpose given changes in the civic landscape.
- Whether any mandate overlaps with other assemblies have emerged that require formal resolution or SAC-type agreement.
- Whether the assembly's coordination track record — CDIA completion, JCP engagement, CRP involvement — reflects appropriate behaviour under this framework.

PMRs are conducted by a Mandate Review Panel, sortition-constituted from outside the assembly under review. PMR findings are published on SCIP. Mandate modifications recommended by a PMR require adoption through the full DD&SA constitutional amendment process.

5.6 The Civic Coordination Support Office

The Civic Coordination Support Office (CCSO) is a small, permanent administrative body — not a governance body — whose sole function is to support the operational mechanics of inter-assembly coordination. It has no decision-making authority. Its functions are:

- Maintaining the Civic Facilitator Register and administering sortition draws for JCPs and CRPs.
- Providing induction and logistical support to JCP and CRP members.
- Monitoring SCIP drift indicators and publishing monthly reports.
- Supporting ACHR and Resident Review Panel processes.
- Administering the CCRF.

The CCSO is itself subject to annual sortition-based oversight by a Civic Oversight Panel of twelve residents, whose findings are published on SCIP. The CCSO's staffing, budget, and operating procedures are reviewed every three years by the Civic Resource Allocation Assembly.

6. Stress-Testing the Framework

6.1 Stress Test One: Large-Scale Emergency Affecting Multiple Domains and Territories

Scenario: A major flooding event affects four regional Territorial Assemblies and triggers simultaneous responses from the Civic Environment Assembly, Civic Housing Assembly, Civic Transport Assembly, and Civic Health Assembly. Normal CDIA and joint session timelines are unworkable. Decisions need to be made in hours, not weeks.

Framework Response: Emergency Coordination Protocol

The IACF includes a standing Emergency Coordination Protocol (ECP), activated by declaration of a Civic Emergency under the DD&SA National Health Crisis Response Framework (NHCRP-001) or equivalent. Under the ECP:

- An Emergency Coordination Council (ECC) is automatically constituted from the current presiding members of all affected assemblies — not a new body, but an accelerated meeting of existing assembly representatives.
- The ECC has authority to issue Emergency Coordination Decisions without completing standard CDIA or CTIA processes. Emergency Coordination Decisions have a maximum validity of thirty days and must be reviewed and either ratified, modified, or lapsed by the relevant assemblies within that period.
- All Emergency Coordination Decisions are published on SCIP within twenty-four hours.
- A post-emergency review is mandatory within ninety days, examining all Emergency Coordination Decisions for proportionality, effectiveness, and cross-domain impact.
- The ECP does not suspend resident observation rights. All ECC meetings are recorded and published, though live-stream may be delayed by up to forty-eight hours where operational security genuinely requires it.

Assessment

The ECP enables rapid coordination without creating a permanent emergency executive. The thirty-day maximum validity and mandatory assembly ratification ensure that emergency powers do not calcify into standing authority. The post-emergency review creates accountability without impeding the response.

6.2 Stress Test Two: Long-Term Infrastructure Planning Across Domains

Scenario: A thirty-year national energy transition plan requires coordinated decisions from the Civic Energy Assembly, Civic Environment Assembly, Civic Housing Assembly, Civic Transport Assembly, Civic Digital Infrastructure Assembly, and dozens of Territorial Assemblies. No single JCP can manage this scope. Normal timelines are insufficient.

Framework Response: Strategic Coordination Programmes

For matters of national, multi-decade scope, the IACF provides the Strategic Coordination Programme (SCP) mechanism. An SCP:

- Is initiated by proposal from two or more Domain Assemblies or by a National Civic Assembly resolution.
- Is governed by a Programme Coordination Charter (PCC) — a long-form SAC-equivalent specifying all participating assemblies, their roles, the decision-making processes, the review schedule, and the escalation pathway.
- Uses a rotating series of topic-specific JCPs rather than a single permanent panel, ensuring fresh resident input at each major decision point.
- Requires a published Strategic Impact Assessment for each major phase of the programme, covering domain and territorial impacts at decade-level resolution.
- Is subject to ACHR review and five-year Periodic Programme Reviews.

Assessment

The SCP mechanism handles genuine complexity without creating a permanent cross-domain authority. The rotating JCP model ensures continued sortition integrity. The PCC provides the institutional memory and process continuity that long-term planning requires. The periodic review cycle prevents programme capture by any single domain interest.

6.3 Stress Test Three: Conflicting Priorities — Economic vs Environmental Trade-offs

Scenario: A Civic Economic Development Assembly issues a decision to permit a major industrial development that the Civic Environment Assembly contends will cause irreversible ecological harm to a designated Ecological Zone. Both assemblies have legitimate mandates. Residents in the affected area are divided.

Framework Response: The Ecological Floor and CRP Process

DD&SA's constitutional architecture includes an Ecological Floor — a set of environmental conditions that are constitutionally non-negotiable and may not be overridden by any assembly decision, including by CRP Coordination Directive. The Ecological Floor includes:

- No irreversible destruction of designated Ecological Zones without a supermajority JTA resolution and a full CTIA.
- No decision that materially exceeds agreed national emissions or pollution standards.
- No permanent loss of primary biodiversity habitat classified as nationally significant.

Where a conflict involves an alleged breach of the Ecological Floor, the CRP process is modified:

- The CRP must include an independent ecological expert panel as part of its evidence base.
- The Ecological Floor status of the matter is determined by the CRP before any substantive deliberation on economic-environmental trade-offs.

- If the Ecological Floor is found to apply, the CRP does not have jurisdiction to authorise a breach. The economic development decision is suspended pending modification.
- If the Ecological Floor is found not to apply, the CRP deliberates on the trade-off using a published proportionality framework that weighs long-term ecological costs against social and economic benefits, with a strong presumption in favour of precaution.

Assessment

The Ecological Floor prevents the CRP from becoming a vehicle for trading away constitutional protections in exchange for economic gain. The precautionary presumption prevents systematic underweighting of long-term ecological harm in short-term economic deliberation. The CRP process ensures resident voices — not assembly positioning alone — determine the outcome of contested trade-offs.

6.4 Stress Test Four: A Dominant Assembly Attempting to Expand Its Influence

Scenario: Over a period of five years, the Civic Digital Infrastructure Assembly (CDIA) has become increasingly involved in cross-domain matters — housing, education, health, transport — because digital systems now underpin all of them. It has begun issuing guidelines that, in practice, constrain the decisions of other assemblies, despite having no explicit mandate to do so.

Framework Response: Mandate Creep Detection and PMR

SCIP's drift monitoring system flags the CDIA's over-representation on coordination processes as a Coordination Log anomaly within the first two years of the pattern emerging. The ACHR for that year includes a dedicated section on CDIA mandate creep. The relevant Periodic Mandate Review is brought forward.

The Mandate Review Panel finds that the CDIA's guidelines are being issued as advisory but are de facto treated as mandatory by recipient assemblies. The PMR recommends:

- The CDIA's cross-domain advisory role is formally characterised as non-binding and must include explicit language stating this in all future publications.
- Any CDIA guideline that affects another assembly's mandate must be accompanied by a CDIA.
- The CDIA's participation in JCPs and CRPs is capped at proportionate representation consistent with its mandate scope.

If the CDIA continues to expand its influence after the PMR, any affected assembly may file a Type 1 or Type 5 CDF. A Conflict Resolution Panel constituted from the affected assemblies and resident pool has authority to issue a Mandate Boundary Directive constraining the CDIA's activities to its defined scope.

Assessment

The combination of SCIP monitoring, ACHR review, PMR, and CRP access creates a multi-layered detection and correction system. No single assembly can expand beyond its mandate without generating visible signals — in the Coordination Log, in the ACHR, and in the Liaison Registers of the assemblies it is engaging with. The absence of permanent executive authority means that mandate creep cannot be consolidated by claiming administrative necessity.

PART VI — INFORMATION ARCHITECTURE AND RESIDENT ACCESS

7. Ensuring Equal Resident Access to Coordination Information

7.1 The Principle of Equal Informational Access

Resident sovereignty cannot be real if residents cannot understand the decisions being made in their name. Cross-domain and cross-territory coordination is inherently complex. Left to institutional actors alone, it becomes opaque — and opacity is the precondition for capture. The IACF therefore includes specific requirements for making coordination information accessible, not merely available.

7.2 Plain-Language Summaries

Every CDIA, CTIA, JCP Coordination Directive, and CRP Coordination Directive must be accompanied by a Plain-Language Summary (PLS). The PLS must:

- Explain, in plain English, what decision is being made and why.
- Describe which assemblies are involved and what their respective positions are.
- Summarise the key evidence considered.
- State the conclusion and what it means for affected residents.
- Be no longer than two sides of A4.

PLSs are published on SCIP alongside the full technical document. The CDSA is responsible for quality-assuring PLSs against a published plain-language standard.

7.3 The Civic Coordination Dashboard

SCIP includes a public-facing Civic Coordination Dashboard that provides, in visual and accessible form:

- A live map of active cross-territory coordination matters, showing affected areas.
- A list of all active JCPs and CRPs, with their mandate, membership, and current stage.
- The Assembly Liaison Register for all assemblies, in searchable and filterable form.
- The Precedent Archive, indexed by domain, territory, and conflict type.
- Monthly drift indicator scores for each assembly.
- The STAR — the Shared Territorial Asset Register — in interactive map form.

7.4 Resident Notification Rights

Any resident may register a notification preference on SCIP, specifying which domains, territories, or asset types they wish to be notified about. Notifications are issued when:

- A new CDIA or CTIA affecting their specified area is published.
- A JCP or CRP relevant to their specified area is formed.
- A Coordination Directive affecting their specified area is issued.
- A drift indicator threshold is breached for an assembly in their specified area.

7.5 Accessible Participation Pathways

Residents may engage with inter-assembly coordination processes through:

- Attending open joint sessions and CRP hearings as observers.
- Submitting written questions to CRP Chairs during hearing processes.
- Signing and initiating Resident Coordination Review Petitions.
- Participating in Resident Input Rounds during deadlock procedures.
- Applying for sortition selection to JCPs, CRPs, and review panels.

PART VII — DEFINITIONS AND GLOSSARY

8. Terms and Definitions

The following terms have specific meanings within this framework. All terms are consistent with DD&SA constitutional vocabulary established in DDSA-ARCH-001 and the Constitutional Grammar Document.

Assembly Liaison Register: A publicly visible record maintained by each SA listing all current inter-assembly coordination engagements, updated weekly on SCIP.

Annual Coordination Health Review (ACHR): A yearly assessment of the inter-assembly coordination system conducted by a sortition-constituted Review Assembly, producing published findings and recommendations.

Civic Coordination Dashboard: The public-facing visual interface on SCIP enabling residents to access coordination information in accessible, map-based, and searchable form.

Civic Coordination Resource Fund (CCRF): A ring-fenced budget allocation funding inter-assembly coordination mechanics, including sortition processes, expert evidence, and the CCSO.

Civic Coordination Support Office (CCSO): A small, permanent administrative body with no decision-making authority, responsible for the operational mechanics of inter-assembly coordination.

Civic Data Stewardship Assembly (CDSA): A standing sortition-constituted body with sole mandate to maintain SCIP's technical integrity, accessibility, and neutrality.

Civic Facilitator: A sortition-selected individual from the Civic Facilitator Register who chairs joint sessions, JCPs, and CRPs without substantive authority.

Civic Mediator: A sortition-selected individual who facilitates Pre-Panel Mediation in conflict resolution processes.

Conflict Declaration Form (CDF): The formal instrument by which an SA declares an inter-assembly conflict, published immediately on SCIP.

Conflict Resolution Panel (CRP): A time-limited sortition-constituted body formed to adjudicate a specific inter-assembly conflict and issue a Coordination Directive.

Coordination Directive: A binding decision issued by a JCP or CRP within its mandate, governing the assemblies subject to it.

Corridor Assembly Group (CAG): The set of Territorial Assemblies through whose territories a defined transport corridor passes, governing the corridor through a Corridor SAC.

Cost and Responsibility Sharing (CRS) Schedule: A component of Shared Asset Charters defining how costs and responsibilities for shared assets are allocated between parties.

Cross-Domain Impact Assessment (CDIA): A structured published document completed by a Domain Assembly before issuing decisions with material cross-domain implications.

Cross-Territory Impact Assessment (CTIA): The territorial equivalent of the CDIA, required where decisions have material cross-boundary consequences.

Decision Sequence Order (DSO): An agreed protocol between assemblies specifying the order in which inter-dependent decisions must be made.

Domain Assembly (DA): A Sortition Assembly constituted to govern a defined framework domain.

Ecological Floor: A set of constitutionally non-negotiable environmental conditions that no assembly decision or Coordination Directive may breach.

Ecological Zone Charter (EZO): A Shared Asset Charter governing a designated cross-territorial ecological zone.

Emergency Coordination Council (ECC): An accelerated meeting of existing assembly representatives convened during a declared Civic Emergency under the ECP.

Emergency Coordination Protocol (ECP): The standing protocol for inter-assembly coordination during declared Civic Emergencies.

Generational Covenant Clause: The DD&SA constitutional requirement that decisions affecting shared ecological assets consider a minimum fifty-year impact horizon, with a ten-year moratorium on reversal.

Joint Coordination Decision: A formally adopted position agreed by all participating assemblies in a joint session, binding on all parties.

Joint Coordination Panel (JCP): A time-limited sortition-constituted body formed to deliberate on a specific cross-domain or cross-territory matter beyond the scope of joint sessions.

Joint Project Panel: A JCP variant with cross-territory composition, constituted to manage the coordination of a major cross-territory infrastructure or service project.

Joint Session: A formal deliberative meeting attended by representatives of two or more SAs, chaired by a sortition-selected Civic Facilitator.

Joint Territorial Assembly (JTA): A standing sortition-constituted body governing a specific shared cross-territorial asset on an ongoing basis.

Mandate Review Panel: A sortition-constituted body conducting a Periodic Mandate Review of an SA.

Periodic Mandate Review (PMR): A five-yearly review of an assembly's mandate definition and coordination track record.

Plain-Language Summary (PLS): A mandatory, two-page accessible summary accompanying every major coordination document.

Precedent Archive: A non-binding SCIP-hosted record of Coordination Directives, cross-referenced for use by future deliberative panels.

Resident Coordination Review Petition (RCRP): A resident-initiated petition requiring one thousand signatures, triggering a targeted review of a coordination system concern.

Resident Review Request (RRR): A resident challenge to a specific CRP resolution, requiring two hundred signatures, triggering a limited review of procedural and factual correctness.

Shared Asset Charter (SAC): A governance agreement between two or more Territorial Assemblies defining joint management of a shared asset.

Shared Civic Information Platform (SCIP): The civic utility providing the technical and institutional infrastructure for inter-assembly information sharing, coordination logging, and public transparency.

Shared Territorial Asset Register (STAR): A SCIP-maintained register of all assets spanning or materially affecting more than one territorial jurisdiction.

Sortition Assembly (SA): Any deliberative governing body constituted by sortition under the DD&SA constitutional framework.

Strategic Coordination Programme (SCP): A governance arrangement for national, multi-decade programmes requiring sustained cross-domain and cross-territory coordination.

Territorial Assembly (TA): A Sortition Assembly constituted to govern the full range of civic matters within a defined geographic jurisdiction.

Territorial Impact Assessment (TIA): An assessment completed by a Domain Assembly before issuing decisions whose implementation falls materially on specific territories.

PART VIII — IMPLEMENTATION PATHWAY

9. From Framework to Practice: Implementation Sequencing

9.1 Phase 1: Foundation Infrastructure (Year 1–2 of DD&SA Transition)

The following elements must be established before inter-assembly coordination can function:

- **SCIP technical build:** The Shared Civic Information Platform must be operational, with Decision Register, Coordination Log, Liaison Register, and STAR functions live before any assemblies are constituted.
- **CDSA constitution:** The Civic Data Stewardship Assembly is among the first bodies constituted under the DD&SA transition, given that it manages the infrastructure on which all other coordination depends.
- **CCSO establishment:** The Civic Coordination Support Office is established, staffed, and operationally ready before the first Domain Assemblies are constituted.
- **Civic Facilitator Register:** A verified register of trained Civic Facilitators is in place, drawn from a national open application process and sortition selection, before the first joint sessions are required.
- **CDIA and CTIA templates:** Standard templates and guidance for completing CDIAs and CTIAs are published and available to all assemblies.

9.2 Phase 2: Domain and Territorial Assembly Coordination Embedding (Year 2–4)

As Domain and Territorial Assemblies are constituted under the DD&SA transition plan:

- **CDIA mandatory from Day 1:** Every newly constituted assembly is formally inducted into the CDIA obligation. First decisions must include a completed CDIA or a published statement that no cross-domain impact applies.
- **Initial STAR population:** Territorial Assemblies are required to nominate shared assets for STAR entry within six months of constitution. The CDSA publishes a baseline STAR within the first year.
- **First ACHRs:** Annual Coordination Health Reviews begin in Year 3 of transition, providing early-warning data on emerging coordination patterns.
- **SAC negotiation support:** The CCSO provides active support to Territorial Assemblies in negotiating their first Shared Asset Charters, prioritising the most critical cross-territory assets (major rivers, energy grids, transport corridors).

9.3 Phase 3: Maturation and Self-Correction (Year 5 onwards)

By Year 5, the inter-assembly coordination system should be operating with:

- At least 90% CDIA and CTIA completion rates.
- A fully populated STAR with SACs in place for all major shared assets.
- At least three full ACHRs completed with published recommendation-response records.
- A functioning Precedent Archive with entries across all major conflict types.
- A track record of CRP and JCP operations providing institutional confidence that the system works.

The first Periodic Mandate Reviews will fall in Year 5 for the earliest-constituted assemblies, providing the first full cycle of mandate accountability.

10. Living Document Status

This framework is a living document. It is subject to review and amendment through the DD&SA constitutional amendment process. The CCSO is responsible for maintaining a version log on SCIP, tracking all amendments, their rationale, and the assembly processes through which they were adopted.

No amendment to this framework may reduce resident transparency rights, weaken the prohibition on permanent supra-assembly authority, or remove any drift-detection mechanism. Amendments may extend, clarify, or add mechanisms, but not remove constitutional safeguards.
